Evidence changes with the stage

1 Disease and mechanism

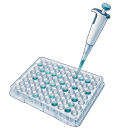

- Cohort
- tissue
- perturbation
- time
- phenotype
- confounders

2 Target identification

- Stable IDs
- isoform/state
- direction
- disease context

3 Target validation

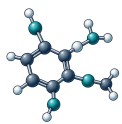

- Intervention
- dose
- model system
- rescue or orthogonal evidence

4 Assay and data strategy

- Protocol
- units
- censoring
- controls
- batch
- provenance

5 Hit discovery

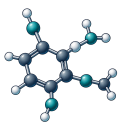

- Search space
- target state
- selection budget
- prospective test

6 Hit confirmation

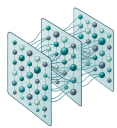

- Orthogonal assay
- purity
- interference checks
- concentration response

7 Hit-to-lead

- Series identity
- potency
- selectivity
- exposure
- synthesis

8 Lead optimisation

- Multi-parameter objectives
- uncertainty
- constraints
- synthesis cycle

9 Candidate nomination

- Integrated efficacy
- safety
- DMPK
- CMC
- translational rationale

Filled squares mark required records. They do not indicate completed measurements.

AI-generated conceptual illustrations. Native labels and relationships.
